

# CL 6710 AQUA TREATMENT COMPOUND

## PRODUCT DESCRIPTION

**CL 6710 Aqua Treatment Compound** is an economical treatment system for cooling tower re-circulating water that prevents corrosion, control scaling, control algae & slime and protect tubings from corrosion.

**CL 6710** is a treatment of cooling tower water is necessary for maximising efficiency of cooling whilst keeping heat exchangers free of scale. Without treatment, scale build-up occurs, leading to high pressure tripping and poor air conditioning and cooling.

**CL 6710** is two in one treatment systems saves storage space and makes for easy ordering unlike other systems which require separate anti-scale and corrosion chemicals.

Where algae growth is prolific due to excessive sunlight and micro-nutrients, additional treatment is sometimes necessary. In such instances use of Biocide, a broad spectrum algacide, is recommended.

## TYPICAL PROPERTIES

Physical state	Liquid
Chemical Family	Chromates, quaternary compounds, softener & anti scaling phosphate complex, azole inhibitors.
Colour	Yellow
pH	Alkaline to litmus
Miscibility	With water in all proportions
Usage	One litre treats 500 litres of re-circulating water (Dose once a week)
Flash point	NIL
